

Grok Bot Marketing Guide by SpaceX Engineers

Includes ready-made prompts

CONTENTS

What's in this guide

Everything here was said or done on stream. Quotes are close to verbatim from the transcript. Two full sessions (marketing, RevOps/MarOps), one growth workshop run live against a product that had launched three hours earlier, and the guests who sell for a living.

00 Who's in this guide

Nine people, with links

02 The team of six

Roles, access, and how each bot was composed

04 Hand over the orchestration

The project-manager bot and templates

06 Growth on launch day

The timeline, then Vincent's workshop against live numbers

08 Creative as code

Remotion ads, a template that markets itself

10 Prompts to paste

Eight prompts, lifted from the stream

01 Doing partner, not thought partner

Josh Kim's frame, and where the tax is

03 The campaign, step by step

One diagram, then seven prompts from research to prod

05 Tools, not rules

RevOps: the self-completing task list and a dating app for leads

07 Distribution

Codie Sanchez: controversy, no ads yet, proof

09 Q&A from the room

Human in the loop, WhatsApp, personality, what stays human

11 Your first week

A checklist

1,908

games in the launch hour, before any marketing

~8%

practice → X sign-in conversion, the funnel Vincent worked on

5.7M

views on Codie's "no ads until \$5-10M" post; ~2,000 sign-ups

2 weeks

idea to adoption for the lead app; 10 hours of that was building

00 · WHO'S IN THIS GUIDE

Nine people

Names as listed on the official Grok Bot Galaxy schedule at x.ai/galaxy, with the auto-captioned transcript corrected against it. Cursor became part of SpaceXAI in August 2026; the team refers to itself on stream as "SpaceX AI."

Josh Kim

Growth marketing, Grok Bot team. Ran "Grok Bot for Marketing" (day 3). Previously Notion, Spotify, First Round.

linkedin.com/in/kimjoshua

Matthew Silberman

RevOps and MarOps, GTM systems. Ran "Grok Bot for Marketing Operations" (day 3) and built the lead-review app.

linkedin.com/in/matthewsilberman

Vincent Zhu

Growth team. Ran the launch-day growth workshop against live numbers (day 3). Previously General Catalyst.

linkedin.com/in/vincentzhu9

Codie Sanchez

Founder, Contrarian Thinking. 36 investments, ~1,600 businesses advised. Guest, day 1: distribution.

linkedin.com/in/codiesanchez

Karen X. Cheng

Director and creative technologist, 3M+ followers. Guest, day 2: the newspaper template.

linkedin.com/in/karenxcheng

Matt Palmer

Developer experience; host all three days. Built the Remotion ads (day 2).

linkedin.com/in/matt-palmer

Roshan Sadanani

Product; host all three days. Ran the growth session with Vincent and the metrics bot on launch day.

linkedin.com/in/roshansadanani

Lauren Tan

Engineering; host all three days. Author of PStack and the software factory that shipped 433 PRs.

linkedin.com/in/laurenelizabethtan

Teresa Hsu

Co-listed on "Grok Bot for Marketing Operations" in the official schedule. Not heard on the livestream transcript.
no verified link

Also on the schedule

Roman Ugarte (Grok Bot 101), Lingxi Li (Engineering), Kevin Niparko (Product Managers), Shub Gaur (Founders), Amrita Venkatraman (Sales Engineering), Simon Lackowski (SDRs), David Gan (Customer Support), Blake Schuller (Post-Sales). Their sessions are in the other role guides and in *Grok Bot Guide by SpaceX Engineers*.

01 · DOING PARTNER, NOT THOUGHT PARTNER

The craft is the orchestration

Josh Kim leads growth marketing on the Grok Bot team (Cursor, now part of SpaceXAI). His correction for marketers: the chatbot you spar with on strategy is a thought partner. These are doing partners. "They'll do it the way that you do it."

Chatbot

"You chat with them, you ask questions, you spar on strategy, maybe you edit copy. But they're really there as your thought partner and not a doing partner."

Co-pilot

Agents that can do tasks with you, "but they still typically require you to babysit them, push them along, particularly for those complex tasks."

Bot

"Always-on, asynchronous AI teammates that actually do and finish the work on your behalf." One bot per job. You message it like Slack. It learns your preferences and gets closer to how you'd do it yourself.

Where the tax is

A campaign slide looks simple. In a real org it crosses research, product marketing, web, performance, analytics. "That context management, the coordination, the orchestration of a campaign like this, that's truly where the craft of the work happens, because it's the crux of our job." So that is what he automates last, and on purpose: first the six specialists, then a seventh bot that studies how he ran them.

What "its own computer" means for a marketer

"You can teach it specific ways that you like to optimize your bidding strategy in ad platforms, or the nuances in how you put together a campaign brief." Anything you do by clicking through a tool, it can be taught to do the same way.

Tools, not rules (Matthew Silberman, RevOps)

"So much of the job is just communicating information out, hoping that people follow guidelines. Finally, we can set up the infrastructure, the internal apps, where those teams can do the work. And the apps are just set up to respect those rules in the first place." Page 7.

"Think of yourselves not as just the people setting rules, processes, but really you are a product manager, and your product is revenue growth."

Matthew Silberman, RevOps and MarOps, SpaceXAI

02 · THE TEAM OF SIX

Crowdsourced, then consolidated

"I would be remiss to say that I built all of these." He asked across the team and the marketplace, "who has the best positioning bot, who has the best ads bot," and consolidated. Demo product: XAir, a fictional airline with a landing page, route search and some existing positioning.

BOT	JOB	ACCESS
Market researcher	Studies the product and the market, finds competitors, reads their sites, names the gaps	The web, its own browser
Product marketer	Positioning brief, one-liners, packaging, value statements, landing-page outline, ad-copy variants	Google Docs and Sheets (MCP)
Website ops	Ships the landing page as a PR and pushes to prod	Write access to the marketing-site repo; Cursor cloud agents underneath
Performance marketer	Builds the campaign shell and traffics the copy	The Google Ads account, via its browser
Marketing analyst	Pulls results, analyses, recommends	Google Ads API
Project manager	Studies the other five and the human's interventions, then runs campaigns as the only point of contact	Everything, through the others

How he composed the positioning bot

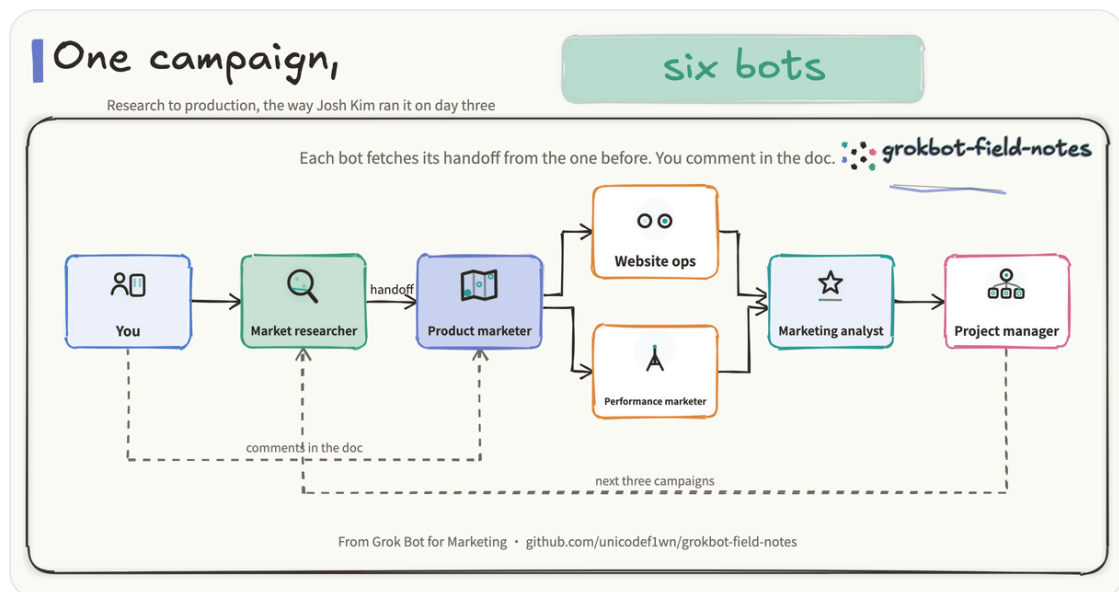

"Mostly a product of me being lazy or not having much time." Four sources, in order:

- 1 **Dictated** for a couple of minutes on how he wanted it to think.
- 2 **Tone and voice from the existing website.** "I had it pull down tone and voice from the current existing website."
- 3 **Two or three marketplace bots he liked, by URL.** "Go scrape up all that context and memory and actually replicate it into the way that you work."
- 4 **An expert marketplace as a check.** Connected it to SuperMe through the plugin: "in lieu of doing scaled qualitative research, go and vet everything you do with experts on the marketplace."

Scope each bot like a job description: swim lanes, responsibilities, tightly specialised. "That's the way you squeeze the most efficiency out of your team of bots."

03 · THE CAMPAIGN, STEP BY STEP

Research to prod, in the order it ran

- 1 **Market research, dictated.** "Study the XAir website, get a deeper understanding of what the product is, what market we're operating in. Now go do a competitive analysis: identify and deeply understand our competitors, look at their marketing websites, understand their positioning, and importantly, identify the gaps and opportunities we have to strategically position against them." It scraped the site, showed a screenshot from its own browser as a progress update, found real airlines, and returned three gaps: **useful time, day design, long hauls**, with a recommendation to lead every message with useful time.
- 2 **Positioning brief, with a handoff.** "Product marketer: go to the market researcher bot, do a handoff of the analysis it just performed, and draw up a draft of a positioning brief: how we should go to market, our one-liners, positioning and packaging, value statements, and examples of how this comes to life across two or three marketing surfaces." It messaged the researcher for context ("I exchanged a few messages with the market researcher bot") and wrote the brief in a Google Doc: target audience, *long-haul travellers who want useful time back*. "That's something you tell it to do in the beginning. Over time it will actually do it proactively."
- 3 **Feedback in the document, the way you'd give it to a person.** He left comments ("this is great, lean into this in our messaging"), then: "I've just left some comments inside the Google Doc. Go through them, take the feedback, incorporate it into an updated draft. While you're at it, build out a full outline of the landing page. And ideate and draft some Google search campaigns to do variant testing between the copy angles you drafted." Back came resolved comments, a fuller outline, and a **sheet of ad variants**: variant name, hypothesis, ad group, URLs, copy. "Because that's typically how performance marketers work."
- 4 **Campaign shell, in parallel.** "Performance marketer: start creating a shell campaign inside Google Ads. Build it so that it's optimizing for clicks, because we're going to do some copy and messaging testing that's being drafted by the product marketer right now." Connected to the Ads account beforehand; it found the drafted copy and built the shell, sending screenshots as it clicked. "I've kicked off two or three jobs in parallel. They're all sharing context with each other while not tripping over themselves."

04 · HAND OVER THE ORCHESTRATION

Steps five to seven

5 Ship the landing page. "Website ops: take the landing page from the latest brief the product marketer just drafted and spin up a PR to push that as a new landing page into the website. Send me screenshots as you're working so I can keep monitoring your progress." It pulled the brief, opened the PR, showed progress, pushed to prod and returned the URL. "All from the one place where all the work is happening."

6 Analysis. He didn't launch this campaign live (that needs a budget and a card), so he pointed the analyst at one from earlier in the week: "Go into Google Ads, pull down the data from our last experiment on messaging, analyze it, tell me the TL;DR of the insights, and give me recommendations on how we should incorporate it into our marketing strategy and update the other assets you've seen." A clear winner across variants, spend, CTR, CVR, and recommendations. "There's some debate of how much liberty you give your agent to make those decisions. In this case it's making recommendations that I can then discuss with the team."

7. Hand over the orchestration. "During this entire demo, I have to be the one actually orchestrating. That's really where the tax is. It's the context switching, having to know the players, understand who's good at what, trafficking and managing that entire process."

Project manager: study and talk to each of the bots in my team and understand what each of their roles is in bringing a campaign to life. Look at our conversations and look at where I had to interject or give guidance or give feedback, and weave that into the way that you work with them. Now kick this off and automate it completely with three new campaigns. Send me screenshots and progress updates so I can stay in the loop. And most importantly: be my point of contact. I don't want to talk to any of the other bots. I only want to talk to you, to save myself the context switching.

It studied the five specialists, listed three campaigns and queued them. "You no longer have to be bombarded with five different messages from different bots. That gives you the clarity to zoom back out and direct your energy toward where the most leverage is."

Share as a template

"Create a template of yourself that I can then share with someone else." A snapshot of the bot, context, memory and routines, that anyone pastes into their own instance. "They have access to literally the way you work." This is also how the six were assembled: from other people's templates. The refined versions go to the marketplace.

Roles or initiatives?

"Initiatives always have a start and stop. These are more always-on." Keep role bots as the individuals that keep learning; put a group of them in a chat per initiative. "You are now a tiger team. The initiative you work on in this group chat is website conversion."

His three lessons

Scope each bot like a job description. **Trust** them: hook up Slack and email and ask, "study all my organizational history and tell me what you can do for me. Take a job off my plate." **Invest:** feedback, context and memory compound.

If you build it, I promise you they will not come.

The one line every guest agreed with. Shub Gaur: sell it before the second bot. Peter Yang: see if they actually pay. Vincent Zhu: PMF before growth. Codie Sanchez: three customers before you decide what to build.

05 · TOOLS, NOT RULES

A dating app for leads

Matthew Silberman is on the combined RevOps and MarOps team at SpaceXAI (GTM systems, ex-Cursor). His bots are named after music gear: OP1 (chief of staff), Fisher (the receiver of every inbox), Juno (product manager), Owned (engineer, knows the CRM, the warehouse and how internal tools get built). Two demos.

Demo 1: the self-completing task list

Fisher runs a routine across email, calendar, texts and Slack. At 9:04 that morning it finished, and while he was on stage it messaged OP1 with everything new. OP1 distilled the messages into actual tasks versus FYIs: "it reads the entire Slack exchange, and it distills for you: here's what that person is asking for."

Then the self-completing part: OP1 spotted a territory dispute between two AEs, relayed it to a **territory-planning bot** that holds the rules of engagement and CRM context, and that bot drafted the resolution. "I didn't even have to think about what we should do about this territory dispute. I just come in and oversee the whole process and finalize things."

"I could turn notifications off on Slack, on email, and I would just know that in the background, my bots are monitoring those channels for me."

Demo 2: the lead app

The classic handoff problem: marketing produces leads, sales says "I don't really love these leads," they go stale, no feedback loop. His fix: an internal app where every AE sees only the leads they own. Swipe left to end it, with a required reason that writes back to the CRM correctly. Swipe right to add it to a follow-up sequence. "We just set up the game for the teams to play."

He told Juno the rough mechanics and, most importantly, that the CRM write-back had to be right. Juno asked follow-up questions first ("really good follow-up questions, things I didn't necessarily think about"), including: when a lead is accepted, what changes in the CRM? Answer: nothing; the existing automation on outreach does that. Then Juno wrote the spec and **handed it to Owned without being told to**.

Idea to adoption: two weeks. Live build: ten hours. The rest was onboarding reps. Lead-review rates hit record highs within two weeks. Reps' reaction: "I'm pretty sure I don't need another dating app in my life."

Hire the team you'd hire

"If someone came to you and said you have headcount to hire a full team, who would be on it? Grok Bot democratizes CEO life: anyone can hire an unlimited set of specialists with the right context and access."

Agency and guardrails together

"They'll always come back to you before they ship anything. Messages, writing back to the CRM, pushing PRs." Knowing exactly what access a bot has is what lets you trust it with bigger tasks.

Break the job into blocks

For ad-platform automation: log in and look at analytics; download a report; read it against everything else. "The better you are at writing detailed instructions for how to do things, the better off you'll be building bots around them."

06 · GROWTH ON LAUNCH DAY

Growth, against live numbers

10:00	11:25	MIDDAY	AFTERNOON	SIGN-OFF
1 post	2,200	3,000+	4,500	30k
Launch from a blank @ThursdayArena account. Best hour of the day: 1,908 games.	practice rounds, ~1,000 X sign-ins, ~500 users. Vincent sits down.	matches. First Diamond player. 400–500 games an hour, sustained.	practice rounds, ~2,000 X logins. Feedback: 71% bugs, 16% praise.	page views, 6,000+ public matches, #1 on Google for the name. \$0 revenue.

At 11:25 Vincent Zhu sat down with Roshan and the live dashboard. Every idea went into a growth bot (also named Vincent) that logged them to a Notion playbook with impact and effort scores.

Ideas, as they came

- **Share button on the leaderboard and on the win screen.** "Old arcade style, you're putting in your name. Press share to post on X and brag to your friends."
- **Share a card, get a rarer one.** Tie rarity to the growth loop: share the bot you made, someone installs it, you get the upgraded version.
- **Direct challenges.** "If I'm Vincent, I want to specifically challenge you." Opens up invite-your-friends. "Words with Friends kind of thing."
- **Welcome DM on follow.** "If somebody follows the handle, automatically DM them: thanks for following, try the game, here's 10 free gold." Speed: "you're following me right now, that means you're interested."
- **Scrape X for what people say.** Done live through the X connector: "search all the feedback to Thursday Arena on X and summarize it in the Notion doc, with user handles." Handles, so the DMs can follow.
- **Sign-in prompt after two or three practice games,** not before the first. And let practice players win a bit more: the design-critique bot had already flagged "the game is too hard for launch."
- **Gold for feedback.** Report a bug through the form, get gold. "You've got to have people care about something."

The metrics bot

Roshan's habit for every launch: "I just spin up a metrics bot. Your job is every 15 minutes, give me the launchables. How many users, how's the feature going, are there bugs we're hearing." A data intern feeding you reports inside the chat, and on demand from Slack when someone asks for a slice.

Outbound from a face they know

People read the sender's name first, not the subject. So outbound comes from someone they've seen on X: "Potato should send emails from Potato, so we can leverage her fan following." Give the bot its own email address; enrich a list of game-studio developers; "we built this on stream, check it out."

The order of operations

"Definitely getting PMF for the game first." Marketing is awareness; growth is what you do once people are in. The danger: "adding too many things, hitting users every which way with some random thing they don't want."

What they picked

Top three: sign-in prompt after a few practice games (high impact, low effort), share from the leaderboard, welcome DMs. "We'll throw agents at them." Later: ~17,000 page views, 44% iOS, referrals almost all X. Eight from Bing.

07 · DISTRIBUTION

Nobody believes anything

Codie Sanchez (Contrarian Thinking) joined on day one: 15M followers, 36 investments, ~1,600 businesses advised, a book launch two days out with a live dashboard of 135,000 sign-ups and paid-vs-organic by channel. The team asked how to get validation. She talked about distribution instead.

Before ads

- **Sell it to three people first.** "Before you even decide what business you want to build, you should see if you can sell it to three people."
- **No paid ads until organic works.** "You don't know your target persona. You have to spend money to find out. And you can put ad spend behind something once you know the organic works. Why put ad spend behind bad ads?" That's how they grew almost every business; then "throw a bunch of dollars on top of it."
- **A little controversy.** "What do you guys believe that other people don't?" The AI-generated "move to Austin" video got roasted for a surfboard scene and did 2.4M views and hundreds of applications. "Don't do ads until you hit \$5 or \$10 million" was hyperbolic on purpose: 5.7M views, ~2,000 book sign-ups.
- **Steal the frame, not the words.** Feed your bot the top posts from people who market well ("connect TweetHunter to X, pull me the top 15"), then write toward your result.

"The ads where it's overly corporate, like our logo is all over it, perform at about 40% the rate of non-corporate ads. Our best performing ads are me and my husband talking to each other, or literally one with our dog in it."

Codie Sanchez, after "a couple million dollars in ads" for one launch

Leads and proof

- **A lead magnet worth 10× the email.** "Give your lead something so valuable they wouldn't feel bad giving you their email." Theirs: a survey built on 15,000 small-business owners that tells you what kind of owner you are. "You could spin up a lead magnet in five minutes."
- **Imitate, iterate, innovate.** "Who already has this type of business that's done it well? Reverse-engineer what they're doing." The prompt she dictated is on page 12.
- **The four reasons people act:** exclusivity, scarcity, timeliness, relevance. Ask the bot what each one is for this product.
- **Logos are about you, not them.** "Everything you sell, that's good for your boss. For the user, what is actually going to make them want to participate?"
- **Proof vault.** "Nobody believes anything, so you have to have proof." Every good thing anyone said, sorted by type: testimonials, video views, screenshots, verified or not, cleared to share or not. "Take screenshots of all the stuff you're building right now. You'll want it in six months."
- **Tie it to revenue.** Small businesses run on ~15% margins. "If you can't tie it to an immediate revenue stream, you're probably not going to sell your AI services very well."

"If you build it, I promise you they will not come."

Codie Sanchez

08 · CREATIVE AS CODE

Assets that update themselves

Remotion ads (Matt Palmer, day two)

"You don't necessarily need to generate videos using a video generation model. If you have code, you can use code as the source of truth." He told the chief-of-staff bot: "Use Remotion for X ads with one-to-one aspect ratios and the current scratch assets, light motion, prioritize the hero on the landing page." It used Dr. Eggbot to stand up a Remotion-ads bot, which noticed there was a Remotion plugin, installed the skills, and spun up a cloud agent.

Why code: "If Lauren has rebuilt the entire app by now and the assets look different, I can just pull those assets through to this piece of content and I'm not losing anything." He iterated in Cursor's design mode ("I don't want shadows or highlights, make the card stack tighter"), got a square video in about five minutes, then generated portrait from the same source. "Are we going to run an ad on this? Probably not. But it's not hard to see the flow where in Grok Bot we're just generating different kinds of Remotion ads."

"Remotion is magical with agents because it speaks code. You've got to play to the agent's strengths."

Aspect ratios first

"What you want in a platform is aspect ratios that work for the platform." Start square; square, portrait and landscape are the three you'll traffic. Generate the rest from the one you like.

A template that markets itself (Karen X. Cheng, day two)

Karen X. Cheng, filmmaker and creative technologist, 3M+ followers, has "very uncreative bot names": a package tracker, a reality-TV tracker, "about 30 morning newspaper bots because I was testing, creating a template."

The newspaper: a bot that prints a personalised paper overnight from your calendar and email: meetings, packages arriving, weather, your Substacks as a reading section, a comic about your day, a crossword with hints from your life, an avatar that looks like you. It asks what time you wake up and starts an hour before. "I sleep next to my printer now."

The marketing part: it's a shared template at newspaper.karenx.com. The setup is "a 30-page long prompt": first the questions it asks you (name, city, avatar, wake time, which subscriptions), then the rules for laying out the paper. Every copy prints the user's name, not hers. The product is the distribution.

Channels nobody is watching (Vincent)

Niche subreddits: "the channels that don't get a lot of love, but there's a lot of people there. You're not publicizing it, you're trying to get feedback, which inevitably gets you more people." TikTok: "the first two to three seconds are key."

09 · Q&A FROM THE ROOM

What marketers asked

I keep waking up to approve tasks. Should I just let it run?

Josh: onboard it like a junior hire. "You're not going to give them the keys to the kingdom immediately. Give them a simple task, hook them up to one or two tools, see that they're delivering value." Then "always allow" per permission once you trust it. The end state exists: "engineers at SpaceXAI with entire armies of bots pushing code to prod. But you've got to start small."

Biggest blocker for marketers?

"They come into the product and don't have a clear understanding of what's actually capable. It won't be valuable if you treat it as another LLM." His team's first move: hook it into Slack as the first line of defence. "Triage it. Message Josh when something's important or urgent. Actually message back the person."

Can it have a personality?

Each bot has its own memory: "tell the project manager to talk to me as if you're Harry Potter and call me a wizard." Live, he regenerated and animated every avatar from one word. You can also point a bot at an agent you built elsewhere and say "replicate that for me."

EU data, training?

Opt-in and opt-out data-privacy modes for training. Security for enterprise is case by case with a dedicated team.

WhatsApp?

Matthew Silberman: no native connector he knows of. Install Beeper, the multi-messenger app, on the bot's computer. "You don't need native connections to anything. Go into the bot's computer, install whatever app you want, and it can use those apps just like you would."

Meta and Google keep logging me out.

1Password integration, announced the day before: share the vault with the bot, then "set up a routine to track whether the login is still active, and if you need to re-auth, have it re-auth for you using what's in the vault."

The dream state: monitor spend, adjust, create the next ad.

"It's really about breaking down into the fundamental blocks of doing this task": log in and read analytics; download the report; read it against the other data. Separate specialised bots per block, working in tandem.

What stays human?

"How many of you knew what RevOps or MarOps was when you were four years old? These are concepts we created around being specialized in certain tools or processes. What it always comes back to is forming relationships, building trust, and solving problems no matter what it takes."

What disappears first from the stack?

"A lot less button clicking and wiring things up. But using complex tools to the extent that it gives you deep familiarity with your profession and taste, that will persist."

10 · PROMPTS TO PASTE

Eight prompts from the stream

Market researcher: study {SITE}, understand the product and the market. Do a competitive analysis: find our competitors, read their marketing sites, understand their positioning, and identify the gaps and opportunities we have to position against them.

Product marketer: go to the market researcher and do a handoff of its analysis. Draft a positioning brief in a Google Doc: how we go to market, one-liners, positioning and packaging, value statements, and how it comes to life across two or three surfaces.

I've left comments in the doc. Incorporate them into an updated draft. Build a full landing-page outline. Draft search-campaign variants to test the copy angles, in a sheet: variant, hypothesis, ad group, URL, copy.

Website ops: take the landing page from the latest brief and open a PR that ships it. Send me screenshots as you work. Push to prod and give me the URL.

Marketing analyst: pull the data from our last messaging experiment in {ADS PLATFORM}. TL;DR the insights, then recommend how to fold them into the strategy and update the other assets you've seen.

Study each bot on my team and how I intervened in our conversations. Weave that into how you work with them. Run the next three campaigns end to end. You are my only point of contact.

Search X for everything people are saying about {PRODUCT}. Summarize it in a new section of the growth playbook, with user handles. – Roshan with Vincent, launch day

Pull me the top {N} people already doing this well, their five best sites, their five best campaign pages, and the five best launches in this category in the last 6–12 months. One document. Ground yourself in our founding doc. – Codie Sanchez

11 · YOUR FIRST WEEK

- **Hook one bot into Slack** as triage. "Message me when it's important." That's the mental-model shift.
- **Two bots, not six:** researcher and product marketer. Chain them with a handoff.
- **Give feedback in the doc**, then tell the bot to read it.
- **Sell it to three people** before the campaign. No paid until organic works.
- **Start the proof vault.** Screenshots of everything, sorted by type.
- **A metrics bot on launch day.** "Give me the launchables."
- **Welcome DM on follow.** Speed to first touch beats copy.
- **Add the PM bot last**, after you've run the loop by hand and it can study you.
